## 1. Numerical Differentiation

When for different values of the independent variable, the corresponding values of the function are known, then finding the differential coefficient of that function at any particular values of the independent variable is called numerical differentiation. Following some of the important point for proper selection of the interpolation formula.

- (i) If the intervals of the variable are equal , then the function can be obtained by Newton Gregory formula.
- (ii) If it is required to find the derivative of the function at a point near the beginning of a set of tabular values , Newton's Gregory forward (backward) formula should be used.
- (iii) If the derivative at a point near the middle of the table, central difference formula be used.
- (iv) If the values of the arguments are unequal spaced, Newton's divided difference formula should be used to represent the function.

**Ex.1 Find first and second derivatives at  $x = 1.1$  from the following table :**

<b>x</b>	<b>:</b>	<b>1</b>	<b>1.2</b>	<b>1.4</b>	<b>1.6</b>	<b>1.8</b>	<b>2.0</b>
<b>f(x)</b>	<b>:</b>	<b>0</b>	<b>.1280</b>	<b>.5440</b>	<b>1.2960</b>	<b>2.4320</b>	<b>4.00</b>

**Sol.** According to the problem, the variable are equidistant and the value of the derivative of the function at  $x = 1.1$  is desired, therefore here Newton's Gregory forward formula is preferred :

**Table-1: Difference Table**

x	f(x)	$\Delta$	$\Delta^2$	$\Delta^3$	$\Delta^4$
1.0	0.0000				
		.1280			
1.2	0.1280		.2880		
		.4160		.0480	
1.4	0.5440		.3360		0
		.7520		.0480	
1.6	1.2960		.3840		0
		1.1360		.0480	
1.8	2.4320		.4320		
		1.5680			
2.0	4.000				

Newton's Gregory forward formula is :  $f(a + xh) = f(a) + C_1 \Delta f(a) + C_2 \Delta^2 f(a) + C_3 \Delta^3 f(a) + \dots$

$$= f(a) + x\Delta f(a) + \frac{x^2 - x}{2} \Delta^2 f(a) + \frac{x^3 - 3x^2 + 2x}{6} \Delta^3 f(a) + \dots \quad \dots(1)$$

Differentiating (1) twice w.r.t.x,

$$hf'(a + xh) = \Delta f(a) + \frac{2x-1}{2} \Delta^2 f(a) + \frac{3x^2 - 6x + 2}{6} \Delta^3 f(a) \quad \dots(2)$$

$$\text{and } h^2 f''(a + xh) = \Delta^2 f(a) + (x-1) \Delta^3 f(a) \quad \dots(3)$$

Replacing  $a = 1$ ,  $h = .2$ ,  $x = 1/2$  and substituting the desired differences from the tables, in (2) and (3)

$$(.2) f'(1.1) = .1280 + 0 + \frac{1}{6} \left( 3 \times \frac{1}{4} - 6 \times \frac{1}{2} + 2 \right) (.480) + 0 \quad \text{or} \quad f'(1.1) = .630$$

$$\text{and } (.2)^2 f''(1.1) = .2880 + \left( \frac{1}{2} - 1 \right) (.0480) + 0 = .2880 - .024 = .264 \quad \text{or,}$$

$$f''(1.1) = 6.60$$

**Ex.2** Find (.04) from the following table :

<b>x :</b>	<b>.01</b>	<b>.02</b>	<b>.03</b>	<b>.04</b>	<b>.05</b>	<b>.06</b>
<b>f(x) :</b>	<b>.1023</b>	<b>.1047</b>	<b>.1071</b>	<b>.1096</b>	<b>.1122</b>	<b>.1148</b>

**Sol.** Here we have to determine the first derivative at  $x = .04$  which is situated in the middle of the table and variable are also equidistant. Therefore here the use of Gauss's forward difference formula is preferred.

Take new variable  $u = \frac{x - .04}{h}$

**Difference Table**

$x$	$u$	$f(x) = y_u$	$\Delta y_u$	$\Delta^2 y_u$	$\Delta^3 y_u$	$\Delta^4 y_u$	$\Delta^5 y_u$
.01	-3	.1023					
.02	-2	.1047	.0024				
.03	-1	.1071	.0024	0			
.04	0	.1096	.0025	.0001	.0001		
.05	1	.1122	.0026	0	0	-.0001	
.06	2	.1148	.0026	.0001	-.0001	0	

**Table-2**

Gauss's forward interpolation formula of new variable  $u$  is :

$$f(u) = f(0) + u \Delta f(0) + \frac{u(u-1)}{2!} \Delta^2 f(-1) + \frac{u(u+1)(u-1)}{3!} \Delta^3 f(-1) + \frac{u(u+1)(u-1)(u-2)}{4!} \Delta^4 f(-2) + \dots \quad \dots(1)$$

Now  $u = \frac{x - .04}{h} \quad \therefore \frac{du}{dx} = \frac{1}{h}$

Also  $\frac{d}{dx} \{ f(x) \} = \frac{d}{du} [f(u)] \cdot \frac{du}{dx} = \frac{1}{h} f'(u)$

Differentiate (1) wrt u and replace u = 0 and substitute the desired differences from the table , we get

$$f'(0) = .0026 - \frac{1}{2} (.0001) - \frac{1}{6} (0) + \frac{1}{12} (-.0001) = .00254 \quad [\text{on simplifying}]$$

$$\therefore \frac{d}{dx} f(x=.04) = \frac{1}{h} f'(u=0) = \frac{.00254}{.01} = .254$$

## 2. ARITHMETIC OPERATIONS OVER BINARY NUMBERS

### Addition-

### Subtraction-

minuend	101101	
subtrahend	- 100111	
sum	000110	Ans.

### Multiplication-

multiplicand	1011	
multiplier	× 101	
	1011	
	0000 ×	
	1011 × ×	
	110111	Ans.

### SUBTRACTION WITH r's COMPLEMENT

The subtraction of two positive numbers (M – N), both base r, may be done as follows:

1. Add the minuend M to the r's complement of the subtrahend N.
2. Inspect the result obtained in step 1 for an end carry:
  - (a) If an end carry occurs, discard it.

# VPM CLASSES

UGC NET, GATE, CSIR NET, IIT-JAM, IBPS, CSAT/IAS, SLET, CTET, TIFR, NIMCET, JEST, JNU, ISM etc.

2's complement of N = 0111100

$$\begin{array}{r} + \\ \text{end carry} \rightarrow 1 \quad \begin{array}{r} 0111100 \\ 0010000 \end{array} \end{array}$$

answer 10000

(b) M = 1000100

1000100

N = 1010100

2's complement of N = 0101100

$$\begin{array}{r} + \\ \text{no carry} \quad \begin{array}{r} 0101100 \\ 1110000 \end{array} \end{array}$$

answer  $-10000 = -(2\text{'s complement of } 1110000)$
